During the cold war, Sweden felt threatened by the Warsaw Pact countries. The country needed an aircraft that could outperform and outmanoeuvre a larger force of advanced fighters.

The north of Sweden is an unforgiving land with long, freezing winters and largely unpopulated areas. It presents a harsh environment in which to operate an aircraft – yet it was this place that gave birth to Gripen.

Defending these vast areas required a fighter that could perform air-to-air, air-to-surface and reconnaissance missions in a single sortie, without the need to return to base for reconfiguration. Gripen was also designed to use roads as temporary runways, allowing the Air Force to use logistical flexibility and speed to keep an invading force at bay.

Easy maintenance and reconfiguration was also vital, as it would need to be performed by Swedish conscripts with only 10 weeks’ training – usually outdoors in freezing, isolated conditions.

Sweden’s relatively small defence budget and the tough conditions under which Gripen was designed, led Saab to make the fighter as efficient as possible. A fundamental aspect of this approach is Gripen’s modular and open avionics architecture. This enables the integration of off-the-shelf products wherever possible, as well as continuous development of new functions to meet future needs.

Gripen NG embodies Saab’s thinking edge by bringing together performance, cost-efficiency and industrial cooperation in one smart fighter system.

CONTINUOUS DEVELOPMENT
Saab works in close cooperation with its customers around the world to help improve the aircraft. Together, we have a long tradition of continuous development. Instead of conducting major and costly mid-life upgrades, Saab uses a short upgrade cycle which provides step-wise improvements. This ensures the fighter is always modern and that upgrades can be adapted to a changing world. Improvement costs are spread out over a long period and each upgrade is not mandatory – they will always remain a customer choice.

FACTS
- Turnaround time: 15 minutes with air-to-air configuration
- Minimal take-off/landing distance: 500/600 m
- Maximum speed: Mach 2 at high altitude
- Time in the air with a typical air-to-air configuration: 2 hours
- Dimensions:
  - Length: 15.2 m
  - Wingspan: 8.6 m
  - Small visual, radar and IR signature
In service for over fifteen years, Gripen is the pinnacle of more than 75 years of Saab’s aircraft design and development experience. The latest NG version is an evolution of the aircraft, building on its strengths and adding further capabilities.

Gripen NG offers a range of options, enabling users to select a bespoke aircraft rather than a set system. Gripen E for example, is the single-seat airframe configuration that has been selected by Sweden.

The C/D versions of Gripen are the current generation of fighters. In service around the world, they are consistently being upgraded and are therefore always ready for modern missions.

**SPECIFICATION**

- **LENGTH**: 15.2 m
- **WIDTH**: 8.8 m
- **MASS WHEN EMPTY**: 8,000 kg
- **INTERNAL FUEL CAPACITY**: 3,400 kg
- **MAX. TAKE-OFF WEIGHT**: 16,000 kg
- **MAX. THRUST**: 98 kN
- **MIN. TAKE-OFF DISTANCE**: 500 m
- **LANDING DISTANCE**: 600 m
- **MAX. SPEED AT SEA LEVEL**: > 1,400 km/h
- **MAX. SPEED AT HIGH ALTITUDE**: Mach 2
- **SUPERCRUISE CAPABILITY**: Yes
- **MAX. SERVICE ALTITUDE**: > 16,000 m
- **FERRY RANGE**: 4,000 km
- **G-LIMITS**: +9G/-3G
- **HARDPOINTS**: 10
- **COMBAT TURNAROUND AIR-TO-AIR**: 10 min
- **FULL ENGINE REPLACEMENT**: <1 hour

**MULTI-ROLE CAPABILITIES**

Gripen is among the first aircraft to focus on more than air-to-air combat. This means that it can cover a full range of mission requirements, saving customers the cost of owning separate bombers and fighters.

From the very beginning, Gripen has been designed to be a true multi-role and swing-role fighter – meaning it can perform air-to-air, air-to-surface and reconnaissance missions. It can change role while airborne, and it can even act in several capacities simultaneously. Gripen NG can perform a wide range of missions, from offensive and defensive counter strikes to air policing and tactical air reconnaissance. These missions can be performed 24/7 in all types of weather.

This multi-role capability will evolve as the fighter’s AESA radar and other systems are further developed.

A multi-role fighter for air-to-air, air-to-surface and reconnaissance missions:

**AIR-TO-AIR**
- Intercept enemy fighters, bombers or reconnaissance threats

**RECONNAISSANCE**
- Identify threats and patrol your borders

**AIR-TO-SURFACE**
- Destroy vehicles, ships, buildings and enemy weapons installations
Knowledge is everything in combat and knowing more than the enemy is vital to mission success.

To achieve information superiority, fighter pilots need to be able to identify enemy assets and share intelligence and assets with wingmen, as well as be able to have it presented to them in a clear way. At the same time they need to stop the enemy from acquiring the same type of information.

Gripen NG’s sensor suite identifies the enemy using a number of active and passive methods while retaining a relatively small radar and infrared signature. The onboard electronic warfare systems can also jam enemy sensors and approaching missiles, while the aircraft’s relatively small size makes it difficult to detect visually.

**MFS-EW**
Electronic Warfare system – a complete, highly integrated suite that includes radar warning receiver, missile approach warning, electronic support measures and countermeasures.

**IRST**
Provides passive situation awareness at long range against air and ground targets.

**ES-05 RAVEN AESA RADAR**
Simultaneously and independently tracks air-to-air and air-to-surface targets.

**MFS-EW**
Electronic Warfare system – a complete, highly integrated suite that includes radar warning receiver, missile approach warning, electronic support measures and countermeasures.

**LITENING**
Precision target pods that significantly improve the effectiveness of stand-off weapons.

**RECCE POD**
Equips the fighter with a full range of reconnaissance capabilities.

---

**RANGE AND MANOEUVRABILITY**

The maximum combat radius for Gripen NG on an air-to-surface configuration is approximately 800 nm (1,500 km). This is defined as flying to a target, releasing air-to-surface weapons, and then returning to home base. The actual combat radius depends on the configuration of the aircraft’s external stores, its profiles and the availability of reserve fuel tanks. Gripen NG’s combat radius meets the needs of air forces around the world, but at a much lower cost than its competitors.

The aircraft’s maximum time on station in a mission depends on the stores carried and the distance from the home base to the combat air patrol station. In a typical air-to-air configuration for example, Gripen NG can patrol for over two hours.

**AIR-TO-AIR REFUELLING**

All Gripen NG are equipped to conduct air-to-air refuelling via the NATO standard probe-and-drogue system. This ability increases its combat radius and/or time on station considerably – in fact, missions of up to eight hours or more can be flown.

**MANOEUVRABILITY**

Gripen NG has a canard-delta wing configuration with relaxed stability. A triplex fly-by-wire aerodynamic control system enables stable and precise flight with highly agile manoeuvring. This aids pilots by optimising their commands across the entire flight envelope. It also reduces the effort required in executing demanding manoeuvres. The flight control system compensates for difficult environmental conditions as well as minimising drag. It is thoroughly tested and ensures care-free flight, meaning that the pilot can never overstress the aircraft except in an emergency.
Gripen NG has weapons for all types of mission, from guided glide bombs for precision engagement with low collateral damage, to long-range and agile air-to-air missiles and heavy anti-ship armaments. Additionally, the aircraft has an inherent precision strike and stand-off capability.

The single-seat Gripen NG is equipped with a 27 mm Mauser BK27 gun. This can be used in air-to-surface attacks against land and sea targets and is suitable for air policing missions. Gripen NG can also carry pods and sensors for reconnaissance and special missions. These include Litening, Recce lite, DJRP and MRPS pods. It is one of the easiest aircraft of its kind to add new weapons to. This makes it a favourite among weapons companies as they can quickly and easily use Gripen for development. For example, it was selected for testing the Meteor missile. This benefits users, as new armaments are available to them more quickly compared to other aircraft.

Gripen NG is built to survive in combat via a series of integrated electronic warfare capabilities that enable smart tactics.
One of Gripen NG’s key strengths is its ability to find and exploit information. That is why it has highly developed net-centric warfare capabilities, including an advanced sensor suite and strong focus on data links for sharing information within a Gripen NG tactical unit or with NATO forces.

Gripen NG’s sensor fusion feature is crucial for communicating all target detection and tracking information to the pilot. This turns information superiority into high situational awareness. Gripen NG fighters share all information via tactical data links, including the NATO Link 16. This is key to the aircraft’s information superiority.

In addition, each pilot can receive data from controllers on the ground or in the air. A digital CAS and video link enables further communication benefits.

Gripen NG is able to participate in joint missions around the world, as well as acting to protect the interests of the user’s nation.

The aircraft is interoperable with army, navy and C2 organisations, and is also fully NATO-compatible. Originally designed to withstand the harsh arctic conditions of northern Sweden, Gripen NG has been adapted to operate in a complete range of extreme climates – from tropical zones such as Thailand, through to the deserts of Africa.
Gripen was originally designed for flexible deployment with a small logistical footprint. This was due to the Swedish Air Force’s policy during the cold war to operate out of a number of dispersed bases across the country. This made it vital to keep staff resources, support systems and spares to a minimum. As a result of this, Gripen was designed to operate from runways only 800 x 16 metres in length. This means it can land on a regular highway, which further improves its logistical flexibility. This capability has been carried over to Gripen NG.

AVAILABILITY

High availability is vital for small air forces. These organisations rely on aircraft that offer a long Mean Time Between Failure (MTBF) and short Mean Time To Repair (MTTR). Gripen NG has been designed with this in mind. For example, the entire engine can be exchanged and tested in the field in less than an hour. These properties, together with low maintenance requirements per flight hour, give the aircraft higher availability than its competitors. Gripen NG has also been designed for minimal turnaround time. For example, an air-to-air combat set up takes only 10 minutes to perform, including refuelling and rearming.

LOGISTICAL FLEXIBILITY

Gripen NG’s modular design greatly enhances its ability to adapt. Using off-the-shelf products and integrating them in an open architecture makes the aircraft development process very flexible. It also enables distributed development of Gripen NG in customer nations as part of industrial cooperation and technology transfer packages.

TYPICAL RUNWAY 45 m x 2,400 m

SWEDISH ROAD BASE 16 m x 800 m

THE WORLD’S MOST ADVANCED AVIONICS

FURTHER DEVELOPMENT AND FUTURE VERSIONS

TWO-SEATER GRIPEN NG

A two-seater version of Gripen NG is in development and will be used for both pilot training and combat missions. For the combat role, this version will be optimised to enable air battle management from the back seat, including jamming, information warfare and network attack capabilities. Weapon System Officer (WSO) and Electronic Warfare roles can also be facilitated from this position.

OPTIONALLY UNMANNED

An optionally unmanned Gripen NG would be useful for a range of situations, for example flying very high risk missions. It provides the operator with the flexibility to use the aircraft daily for either manned or unmanned missions.

SEA GRIPEN

Sea Gripen is a carrier-based fighter that enables affordable naval air power. It will make a first-class carrier-based fighter and will retain the combat capabilities offered by the regular NG version.

*This image has been digitally created using 3D modelling software
An aircraft’s lifecycle cost includes everything from initial acquisition spend through to operational expenses across its entire lifetime. Gripen NG has a very low lifecycle cost compared to its competitors.

The graph to the right shows an independent study on costs relating to next generation fighter systems. It shows flight hour costs for Gripen C/D and was conducted by IHS Jane’s, based on open sources. Gripen NG has been further improved to continue this trend of reducing flight hour costs.

**COST CONSCIOUSNESS FROM THE START**

From the very beginning, cost has been a pivotal design parameter for Gripen. This is also true for Gripen NG. Throughout design and construction, Saab has ensured that the aircraft is easy to service and repair – even outdoors, by conscript soldiers with minimum resources. Our engineers are asked to maximize performance at a set cost. This way, Saab avoids expensive solutions that may not add as much to performance as their cost would suggest.

Cost is also a design parameter in the sense that every detail is created for maximum ease of use and low cost to maintain, and the whole lifecycle is taken into consideration when these prioritizations are made. This is not something that can be added later. This must be built in from the very beginning.

**WE SELECT THE BEST SUPPLIERS**

Saab constantly scans the market to ensure that its customers gain value from the Gripen NG supply chain. For every system category, we seek to buy the best materials for the best possible price.

**LEAN MODEL-BASED DEVELOPMENT**

Gripen NG is designed and manufactured using a lean model-based development process. Our models provide early validation and reduce risk. They are used during the upgrade cycle, enabling updates to be implemented considerably faster.

**BREAKING THE COST CURVE**

**OPERATIONAL EFFECT**

**1ST GENERATION**

- Production and development cost
- Operational and maintenance cost
- Cost

**2ND GRIPEN C/D**

**3RD GRIPEN E**

**MISSION SUPPORT SYSTEM**

- Used by pilots and MSE officers to plan, rehearse, brief, evaluate and debrief missions.

**DIGITAL MAP GENERATING**

System for creation and administration of geographical databases used in the aircraft, simulators and support systems.

**EW SUPPORT SYSTEM**

For development of electronic warfare and target recognition libraries.

**MAINTENANCE GROUND SUPPORT SYSTEM**

For evaluation and administration of maintenance data recorded in the aircraft and for upload of software and data to the aircraft.

**IMAGE ANALYSIS**

For storage and analysis of reconnaissance images.

**Most aircraft training is conducted in simulators**, including Saab’s own specialized Gripen trainer. This offers training for both pilots and technical staff on a wide range of areas.

A range of other simulators with different levels of complexity are also offered by Saab, from small desktops to large full mission simulators. They provide high fidelity visual environments, realistic threats, simulation of system behaviour and aircraft characteristics.

Simulators can also be linked to provide multi-ship training.

Gripen NG’s weapon system includes an aircraft support system that is based on a common client server platform. This provides several functions:

**MISSION SUPPORT SYSTEM**

- Used by pilots and MSE officers to plan, rehearse, brief, evaluate and debrief missions.**
Saab’s opportunities on the world market have been solidified and expanded, following the order from Sweden for Gripen E. This has been further bolstered by Brazil’s decision to select Gripen NG for negotiations. These events have pushed Gripen to the forefront of the global fighter market and mean that we are a leading player, with increasing interest in all regions – from the Americas to Asia.

With defence budgets tightening, affordability becomes an ever more important factor in Customer Nation’s selection process. The fighter is now recognised and accepted as the logical solution, capable of fulfilling almost any national need for a true multi-role fighter.

With moderate operational and maintenance costs that no other aircraft even comes close to matching, Gripen is unique and increasingly popular. In addition, its development programme will enable industrial cooperation and technology transfer to each customer country’s industry. That is why we call it the smart fighter.
